Live Coding: Item Journal Bulk Post

Problem

Users sometimes post very large item journals (20,000+ lines). Posting them as one transaction locks the item ledger and related tables for minutes, blocks other users, and if line 19,500 fails, everything rolls back.

Requirements

1. Add an action **Bulk Post** to the Item Journal page.
2. Bulk Post must:
   a. Split the journal batch's lines into chunks of 1,000 lines (make the size a parameter or setup value).
   b. Post each chunk as its own transaction, so other users are not blocked while the whole journal is processed.
   c. Let the user choose between posting in the current session (synchronous) and in a background session. (bonus points)
3. Error handling:
   a. If a chunk fails, log the error and continue with the remaining chunks.
   b. Log each chunk's result to a table.
   c. When all chunks are done, show a summary page with successes and failures per chunk.
4. Use the standard posting routine. Do not reimplement posting.

Notes

- You may use AI tools (Copilot, Claude, ChatGPT, etc.). Please share the AI window along with your editor, and tell us what you ask it and why you accept or change what it gives you.
- You do not need to compile against a live environment. Pseudo-code is acceptable where you would normally look up an exact signature, but say so out loud.
- If a requirement is unclear, decide, and add a comment explaining your decision.
- Please narrate as you go. We are more interested in how you reason than in a finished product.
